Test sheet: the mark-axis rule, threshold 10 or exact

The patched fonts apply the mark-axis rule to every symmetric above mark: where its k is 10 or more from K (0; 150 in semibold italic), its anchor X is moved onto its axis ($k = K$). The question is whether the threshold should be lower, for very symmetric marks such as the ring, where a few units may show. “Rule” rows are the patched fonts (threshold 10); “exact” rows are the patched fonts with every symmetric above mark exactly on its axis, curated anchors included (threshold 0). Blue: the designer’s precomposed letter (not changed). Black: base + mark, placed by the anchors. k is now measured on the mark’s ink (its bounds with the slant removed).

What is left under the rule: $k - K$, in units (positive: the mark lands right of its axis)

Rows below are shown for the marks with $|k - K| \geq 3$ in that style; a mark at 0 does not move.

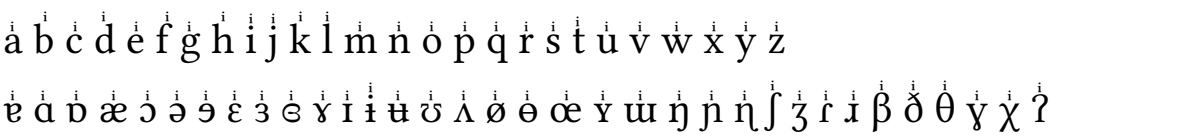

mark	Regular	Italic	Semibold	Semibold italic
